WALL ASSEMBLY NOTES

1) Stone and Masonry veneer to be installed in strict conformance with ESR Reports (ICC) for manufacturer selected. Comply with the Masonry Veneer Manufacturers Association requirements & specifications for systems not evaluated by ICC, 2012 International Building Code requirements and industry recognized trade standards.

2) U.I.O., Concrete Slab (Re: Structural for thickness and reinforcing) on 2" sand (optional, provide allowance) over 10mil vapor barrier on 4" thk. layer of gravel 1/2" to 3/4" size (also Re: soils report). Use smooth gravel where 2" sand is omitted.

3) GYP PANELS:
a) Use water and mold resistant glass fiber-faced substrate at pool walls and ceilings, shower walls and plumbing walls;
b) Use moisture resistant non-paper-faced substrate at all other bathroom and restroom walls;
c) Use water, mold, and indentation resistant non-paper-faced underlayment for all carpet, vinyl, and tile interior floor covering over slab on grade where recommended by manufacturer.

4) FIRE RATED ASSEMBLIES - Maintain required fire-rating of all assemblies. Many approved recessed lighting fixtures require special protection. Consult the fire test report or listing for the specific system for protection details and the opening area limitation.

5) Weather Resistive Barrier to be DuPont™ Tyvek® Commercial Wrap System and system accessories, or approved equal.

6) Fire-rated features take precedence over acoustical features.

7) Provide Denshield or approved equal at all tub/shower locations.

8) All exterior walls to receive a separate interior vapor retarder membrane at studs.

DRAFTSTOPPING/FIREBLOCKING NOTES

1) Fireblocking to comply with IBC 718 - CONCEALED SPACES.

2) Provide Fireblocking at the following locations:
a. Horizontally at all interior and exterior walls at 10'-0" O.C. max.
b. Vertically at all floor and ceiling levels.

3) Provide Draftstopping vertically at all concealed roof spaces between each individual dwelling unit and corridor up to roof sheathing.

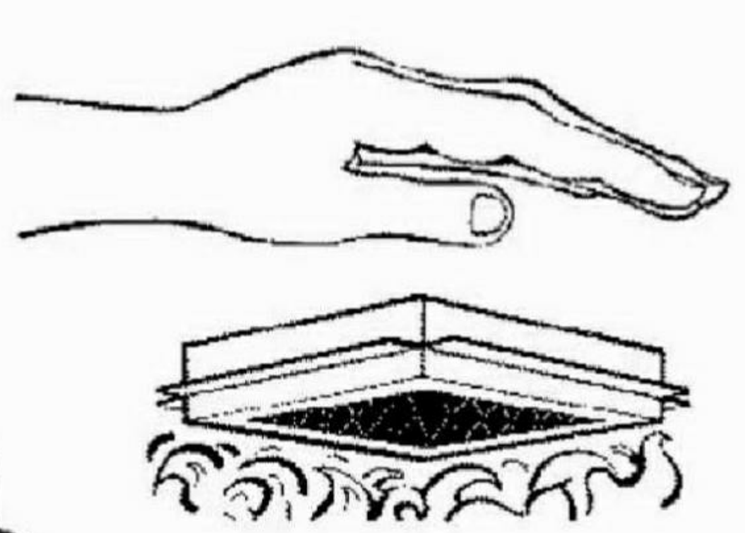
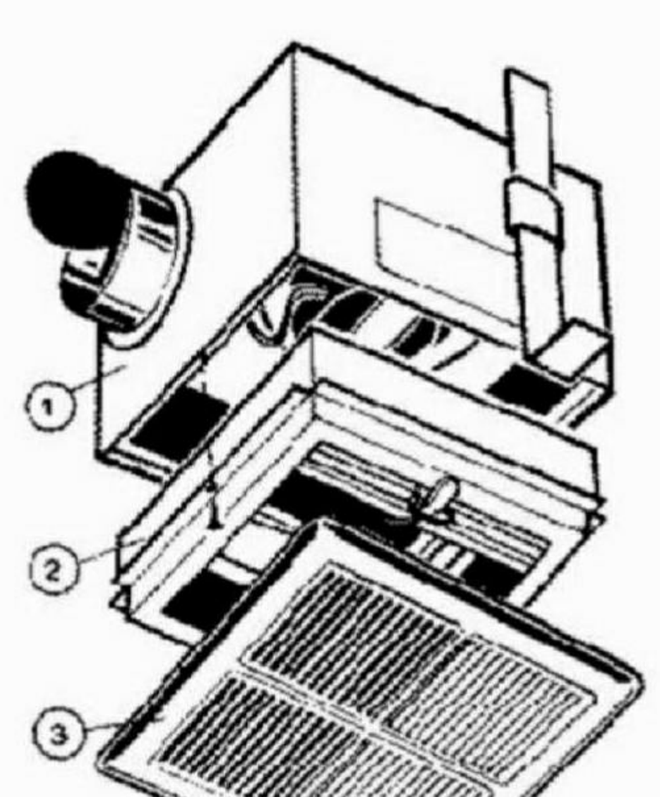
EXHAUST FAN WITH CEILING RADIATION DAMPER





1. Reversomatic Exhaust Fan
2. Firefighter Radiation Damper. Fits inside Fan Housing
3. Ceiling Grille. Fits over Firefighter Damper

The "Firefighter" is the simple solution for fire rated ceilings, that requires a maximum of 3 hours fire resistance.
The "Firefighter" radiation damper and fan housing combination features the lowest height assembly in the industry.
The REVERSOMATIC Ceiling fan, with built-in Fire Radiation Damper, offers the best protection against flame penetration and radiant heat.
All REVERSOMATIC "Firefighter" fans are factory-assembled as one complete unit to guarantee proper installation and consistent workmanship.
Now specify the perfect combination REVERSOMATIC ceiling exhaust fans with Built-in FIREFIGHTER dampers.
Normal operation REVERSOMATIC fans perform their job of removing specified quantities of air quietly and efficiently.
The Firefighter ceiling damper is normally in the open position out of the air stream. In case of fire, the fusible link separate, and a non-asbestos ceramic blanket closes off all air movement throughout the fan.

Installation instructions for CP 606

Opening
1. Clean the opening. Surfaces to which CP 672 will be applied should be cleaned of loose debris, dirt, oil, wax and grease. The surface should be moisture and frost free.

Application of firestop
2. Insert fill of mineral wool or backer (as required).
3. Apply firestop over backer.
4. Smooth firestop sealant with a trowel before the skin forms. Once cured, CP 606 can only be removed mechanically.
5. For maintenance reasons, a penetration seal can be permanently marked with an identification plate and fastened in a visible position next to the seal.

Notice about approvals
- When using Hilti CP 606 Flexible Firestop Sealant, check that the joint or pipe application has been sealed according to the applicable drawing in the UL Fire Resistance Directory or the Hilti Firestop Manual.

Not to be used...
- On areas immersed in water

Safety precautions
- Keep out of reach of children
- Read the Material Safety Data Sheet
- Eyes and hands must be suitably protected
- Avoid contact with eyes/skin
- Only use in well ventilated areas

Storage
- Store only in the original packaging in a location protected from moisture at a temperature of 40°F to 77°F (5°C to 25°C)

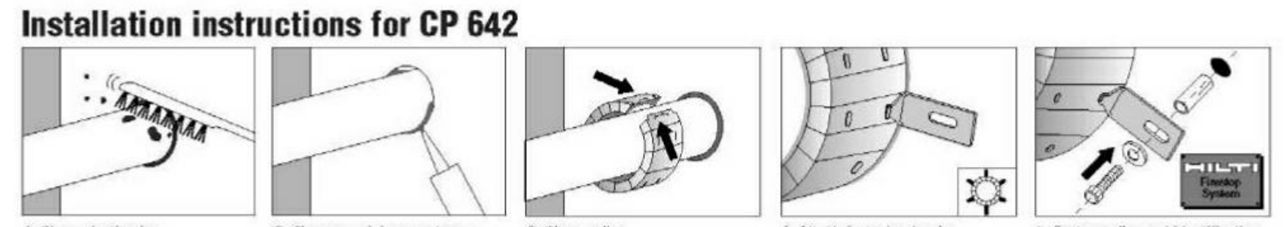
Installation instructions for CP 642



Opening
1. Clean the plastic pipes. Expansion of the intumescent material during a fire acts to close the plastic pipe. Very dirty pipes with, for example, remains of mortar, may lead to a delay in this closing action. Soiled plastic pipes should, therefore, be cleaned in the area where the CP 642 firestop collar is to be installed.

Application of firestop system
2. Seal the opening. Gaps must be closed with FS-ONE. The approved methods vary and are given in the specific UL system.
3. Close the CP 642 firestop collar. Place the CP 642 firestop collar around the plastic pipe and lock the closure with firm pressure until it latches.
4. Attach fastening hooks. The fastening hooks can be attached to various points on the metal housing. This allows the fastening points to be made to suit the space available in each case. The hooks must be positioned as symmetrically as possible. The required number of fastening hooks is indicated on the packaging.
5. Fastening the CP 642 firestop collar. Only when fastened properly can CP 642 protect against fire passing through.
   a. Mark the fastening points.
   b. Drill holes with a Hilti rotary hammer drill (i.e. TE 5) or, depending on base material, fasten using Hilti power actuated tool (e.g. DXA 40).
   c. To secure the CP 642 firestop collar, use Hilti anchors/fasteners.
   d. For maintenance reasons, a penetration seal could be permanently marked with an identification plate. In such a case mark the identification plate and fasten it in a visible position next to the seal.

Notice about approvals
- When making a pipe seal using Hilti CP 642 Intumescent Firestop Collar, please refer to the UL directory or Hilti Firestop Manual for restrictions as to opening size, type and thickness of wall or floor, maximum pipe diameter, etc.

Not for use...
- With metal pipes
- In highly corrosive surroundings
- With unapproved anchors/fasteners

Safety precautions
- Keep out of the reach of children
- Read the Material Safety Data Sheet

Storage
- Store only in the original packaging in a location protected from moisture

Notice
- Before handling, read Material Safety DataSheet and product label for safe usage and health information.
- Instructions below are general guidelines — always refer to the applicable drawing in the UL Fire Resistance Directory or Hilti Firestop Systems Guide for complete installation information

Application of firestop putty
1. Remove label from one side of pad. For a 1 to 2 hour fire rating, one CP 617 pad is required. Exposed side of pad is placed against box.
2. Adhere pad to side of the box, overlapping the stud and all edges of the box. When drywall is installed: fix pad into gap between electrical box and gypsum board slightly overlapping the inner wall board surface. When drywall will be installed later: overlap front edge of electrical box so that CP 617 will be compressed around edges of box as gypsum board is installed.
3. Reshape CP 617 to fit around conduit or cables.
4. Press CP 617 to all sides of electrical box. Trim excess at corners and apply to conduit fittings connected to the box.
5. Remove other side of label. To help prevent passage of cold smoke, CP 617 may optionally be placed into inside of electrical conduit fittings.

Installation instructions for FS-ONE

Notice
- Before handling, read Material Safety DataSheet and product label for safe usage and health information.
- Instructions below are general guidelines — always refer to the applicable drawing in the UL Fire Resistance Directory or Hilti Firestop Systems Guide for complete installation information

Opening
1. Clean the opening. Surfaces to which FS-ONE will be applied should be cleaned of loose debris, dirt, oil, moisture, frost and wax. Structures supporting penetrating items must be installed in compliance with local building and electrical standards.

Application of firestop sealant
2. Install the prescribed backfilling material type and depth to obtain the desired rating (if required). Leave sufficient depth for applying FS-ONE.
3. Application of firestop sealant: Apply FS-ONE to the required depth in order to obtain the desired fire rating. Make sure FS-ONE contacts all surfaces to provide maximum adhesion. For application of FS-ONE use a standard caulking gun, foil pack gun, bulk loader and bulk gun. With FS-ONE buckets, Graco type sealant pumps may be used. (Contact pump manufacturer for proper selection).
4. Smoothing of firestop sealant: To complete the seal, tool immediately to give a smooth appearance. Excess sealant, prior to curing, can be cleaned away from adjacent surfaces and tools with water.
5. Leave completed seal undisturbed for 48 hours.
6. For maintenance reasons, a penetration seal could be permanently marked with an identification plate. In such a case, mark the identification plate and fasten it in a visible position next to the seal.

Not for use
- High movement expansion joints
- Underwater
- On materials where oil, plasticizers or solvents may bleed i.e. impregnated wood, oil based seals, green or partially vulcanized rubber
- In any penetration other than those specifically described in this manual or the test reports

Storage
- Store only in the original packaging in a location protected from moisture at temperatures between 40°F (5°C) and 86°F (30°C)
- Observe expiration date on the packaging
